

ABSTRACT OF THE DISCLOSURE

There are provided a first casing 100A that has a  
photosensor section 113 for capturing an image, a second  
casing 100B that has a lens section 122 for projecting the  
5 image of a subject onto the photosensor section 113 of the  
first casing 100A and a connection section 100C that  
foldably connects the first casing 100A with the second  
casing 100B. The photosensor section 113 and the lens  
section 122 are arranged so that the photosensor section  
10 113 and the lens section 122 are superposed on each other  
in a state in which the first casing 100A and the second  
casing 100B are folded together. With this arrangement,  
the folding type camera device and the folding type  
portable telephone equipped with this device can be reduced  
15 in thickness.
